Results · Process · Stack

Results & how I deliver.

What changed in production, how I run a project from the first call to handover, and the stack I build with. Every number comes from a change I made and measured.

Before and after, from real production work

PROJECT	WHAT	BEFORE	AFTER	HOW
Cunocovo	Feed API latency	3 s	**700 ms**	Composite index, 9 unused columns removed, query rewrite, 5-min cache
Cunocovo	Comment button response	~2 s	**0 ms**	Removed a redundant API pre-check already available in local state
Cunocovo	Notification duplicates	Under load	**0**	Transaction plus unique constraint replaced a check-then-insert race
Cunocovo	Hosting migration	AWS EC2	**Fly.io, 0 downtime**	Phased cutover, DNS TTL lowered ahead, EC2 kept as fallback
Intimec IGA	Inter-service latency	REST baseline	**-50%**	gRPC with Protocol Buffers for synchronous calls
Intimec IGA	Search index	Schema drift	**5M+ docs, 0 downtime**	Alias-based migration; 100K+ logs per cycle after redesign
Intimec IGA	Bulk role assignment	Needed engineers	**5,000+ users / run**	Async, chunked processing with progress and partial-failure recovery
GovHub	HR workflows	Paper + spreadsheets	**Digital, 15,000-employee scale**	Configurable approvals, offline attendance sync, audit trail

Each figure was measured with logs, query plans or timing comparisons

Details in the case studies PDF

Five steps, no surprises

01

Scope

We agree on what is in, what is out, and what "done" looks like before any code is written.

Why: GovHub phases were planned so Phase 2 touches one method.

02

Design

Data model, API shape and the few decisions that are expensive to change later, written down.

Why: domain modules with no circular dependencies.

03

Build

Working increments you can click through. Frontend, API and database move together.

Proof: Access Portal built end to end, UI to events.

04

Harden

Validation, error paths, load behaviour, security basics and CI checks before release.

Proof: caught two compliance bugs before production.

05

Ship & hand over

Deployed with a rollback path, environment docs and a walkthrough so you are not locked in.

Proof: zero-downtime migrations; onboarding docs written from scratch.

The stack I ship with, and what you receive

Frontend

Next.js · React · TypeScript · Tailwind · shadcn/ui · TanStack Query · Flutter

Backend & data

Node.js · NestJS · Express · Spring Boot · PostgreSQL · Prisma / Drizzle · Redis · Kafka / BullMQ · JWT + OAuth

Delivery

Docker · GitHub Actions · AWS · Fly.io · Render · Cloudflare R2

WHAT YOU GET

- **Source code** in your repository, with a clean commit history
- **Deployed app** on your hosting, with environment variables documented
- **Setup and handover notes** so another developer can pick it up
- **Auth, validation and error handling** built in, not bolted on
- **CI checks** on every merge where the project allows it

Send me your idea or an existing codebase.

I reply with scope, risks and a clear plan. talhaatif.tech · github.com/M-Talha-Atif
